

Why Upgrade to Hunter Hydrowise®?

Reduce Water Usage

Hydrowise automatically adjusts irrigation schedules using local weather data—including temperature, rainfall, humidity, and wind. Many properties see up to 50% water savings compared to traditional timers. The system will stop watering in advance of forecasted rainfall.

Smart Rainfall Intelligence

Unlike a standard rain sensor, Hydrowise tracks forecasted and actual rainfall, automatically suspending irrigation and keeping the system off for the appropriate number of days based on how much rain has fallen.

Remote Management

Once connected to the internet, the controller can be viewed and managed from any computer or smartphone. P&L Landscaping can make seasonal adjustments, answer questions, and troubleshoot many issues remotely—saving time and reducing service costs.

Fewer Service Calls

Because we can access your controller remotely, routine programming changes for summer heat or cooler fall temperatures often don't require a site visit.

Optional Flow Monitoring

An optional flow meter can detect:

- High water flow
- Low water flow
- No water flow
- Leaks
- Broken pipes
- Stuck valves

Alerts are sent immediately, allowing repairs before they become expensive problems.

Protect Your Investment

Maintaining proper irrigation promotes healthier turf and landscaping while reducing water waste, runoff, and unnecessary wear on your irrigation system. Internet Connection Required

Hydrowise's smart features require an internet connection. If internet is not currently available at the controller location, the system can be installed and operated in offline mode until service or a Wi-Fi extender is added.
